Subject: PMRA inquiry - Protocols for testing rodenticide bait stations
Date: 05/01/2012 09:30 AM

Hello Bill,

I have 2 quick questions with regards to the protocols used for testing rodenticides bait stations:

1- I have a copy of the revised protocol OPP Designation 1.230 (dog study) (dated May 29, 2009). I was wondering if protocols OPP Designations 1.228 (adult study) and/or 1.229 (child study) have also been revised? The versions I have are dated October 29, 1987.

2- From previous communications with the EPA, I understood that the number of test subjects for the adult study had been revised to a total of 100 subjects (vs 200: 100 parent-aged subjects + 100 grandparent-aged subjects). Could you please clarify what the **age/gender distribution** requirements are for the 100 subjects?

Thank you for your assistance,
Anie

p.s. Could you please cc Wendy Burpee (cc'd on this email) on your reply. Thanks.
